

## Gas ultrasonic flowmeter for permanent installation

Transmitter for permanent outdoor wall or pipe mounting

### Features

- Exact and highly reliable bidirectional clamp-on flow measurement of operational and standard volume flow rates as well as mass flow rates
- Installation and startup do not require any pipe work nor any process interruptions
- High measurement accuracy even at very low as well as very high flow rates and independent of the flow direction (bidirectional)
- Automatic loading of calibration data and transducer recognition
- Bidirectional communication and support of common bus technologies (Profibus PA, Foundation Fieldbus, HART, Modbus, BACnet)
- Advanced self-diagnosis and possibilities for event based triggering of data recording for the supervision and control of critical processes
- Transmitter and transducers for use in hazardous areas are available
- Transmitter and transducers are separately calibrated (traceable to national standards)
- Transducers available for a wide range of inner pipe diameters and fluid temperatures
- The measurement is zero point stable, drift free and independent of the pipe material as well as the process pressure (min. 45 to 100 psi on steel pipes; no minimum pressure for plastic pipes) and the process fluid
- The measurement system also precisely measures wet gas flow rates up to 5 % LVF (liquid volume fraction)

### Applications

- Chemical industry
- Petrochemical industry
- Oil and gas industry
- Manufacturing industries

## Function

### Measurement principle

The transducers are mounted on the pipe which is completely filled with the fluid. The ultrasonic signals are emitted alternately by a transducer and received by the other. The physical quantities are determined from the transit times of the ultrasonic signals.

Path of the ultrasonic signal in the flowing fluid

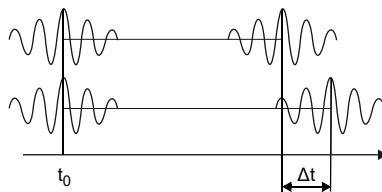

As the fluid where the ultrasound propagates is flowing, the transit time of the ultrasonic signal in flow direction is shorter than the one against the flow direction.

The transit time difference  $\Delta t$  is measured and allows the flowmeter to determine the average flow velocity along the propagation path of the ultrasonic signals. A flow profile correction is then performed in order to obtain the area averaged flow velocity, which is proportional to the volumetric flow rate.

The integrated microprocessors control the entire measuring cycle. The received ultrasonic signals are checked for measurement usability and evaluated for their reliability. Noise signals are eliminated.

Transit time difference  $\Delta t$

### Calculation of volumetric flow rate

$$\dot{V} = k_{Re} \cdot A \cdot k_a \cdot \frac{\Delta t}{2 \cdot t_y}$$

where

- $\dot{V}$  - volumetric flow rate
- $k_{Re}$  - fluid mechanics calibration factor
- $A$  - cross-sectional pipe area
- $k_a$  - acoustical calibration factor
- $\Delta t$  - transit time difference
- $t_y$  - average of transit times in the fluid

## Number of sound paths

The number of sound paths is the number of transits of the ultrasonic signal through the fluid in the pipe. Depending on the number of sound paths, the following methods of installation exist:

- **reflect arrangement**

The number of sound paths is even. The transducers are mounted on the same side of the pipe. Correct positioning of the transducers is easier.

- **diagonal arrangement**

The number of sound paths is odd. The transducers are mounted on opposite sides of the pipe.

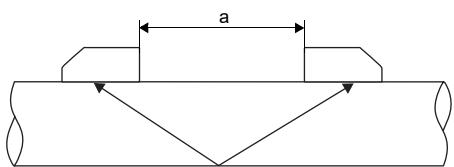

- **direct mode**

Diagonal arrangement with 1 sound path. This should be used in the case of a high signal attenuation by the fluid, pipe or coatings.

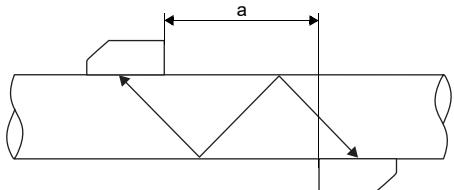

The preferred method of installation depends on the application. While increasing the number of sound paths increases the accuracy of the measurement, signal attenuation increases as well. The optimum number of sound paths for the parameters of the application will be determined automatically by the transmitter.

As the transducers can be mounted with the transducer mounting fixture in reflect arrangement or diagonal arrangement, the number of sound paths can be adjusted optimally for the application.

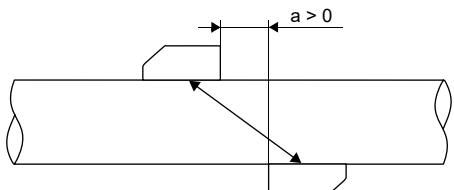

Reflect arrangement, number of sound paths: 2

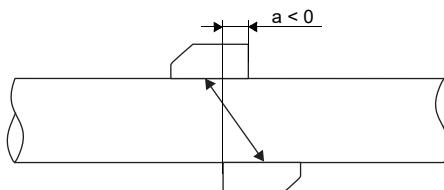

Diagonal arrangement, number of sound paths: 3

Direct mode, number of sound paths: 1

Direct mode, number of sound paths: 1, negative transducer distance

a - transducer distance

## Standard volumetric flow rate

The standard volumetric flow rate can be selected as physical quantity to be measured. It will be calculated internally by:

$$\dot{V}_N = \dot{V} \cdot \frac{p}{p_N} \cdot \frac{T_N}{T} \cdot \frac{1}{K}$$

where

$\dot{V}_N$  - standard volumetric flow rate

$\dot{V}$  - operating volumetric flow rate

$p_N$  - standard pressure (absolute value)

$p$  - operating pressure (absolute value)

$T_N$  - standard temperature in K

$T$  - operating temperature in K

$K$  compressibility coefficient of the gas: ratio of the compressibility factors of the gas at operating conditions and at standard conditions  $Z/Z_N$

The operational pressure  $p$  and the operational temperature  $T$  of the fluid will be entered directly as fixed values into the transmitter.

or:

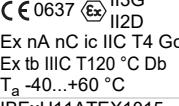

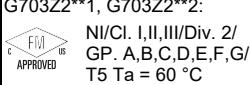

If inputs are installed (optional), pressure and temperature can be measured by the customer and fed in the transmitter.

The gas compressibility coefficient  $K$  of the gas is entered in the transmitter:

- as fixed value or
- as approximation according to e.g., AGA8 or GERG

| terminal               |
|------------------------|
| P1+ to P2+, P1- to P2- |

<sup>1</sup> cable (by customer):

- e.g., flexible leads, with insulated wire end ferrules, lead cross sectional area: AWG14 to 24  
- outer diameter of the cable (\*721\*\*-\*\*\*\*S with ferrite nut): max. 0.3 in

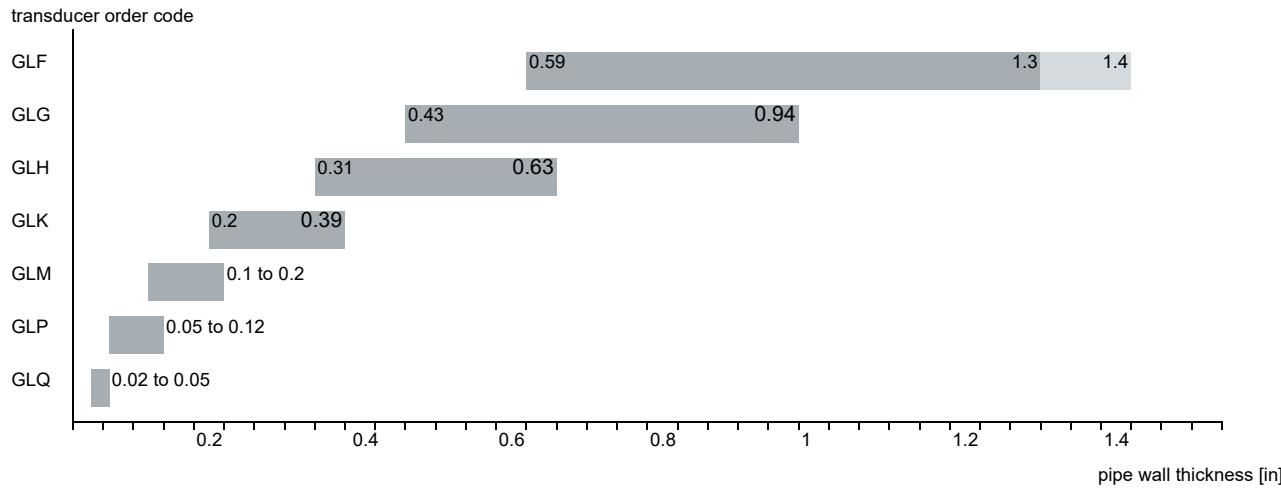

<sup>2</sup> The number, type and terminal assignment will be customized.

## Transducers

### Transducer selection

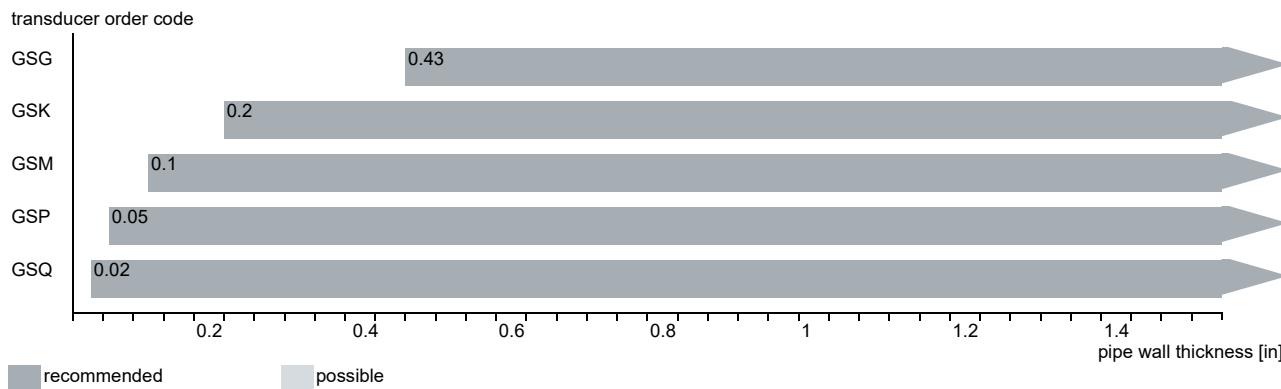

#### Step 1a

Select a Lamb wave transducer:

#### Step 1b

If the pipe wall thickness is not in the range of the Lamb wave transducers, select a shear wave transducer:

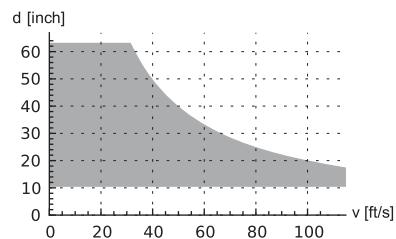

#### Step 2

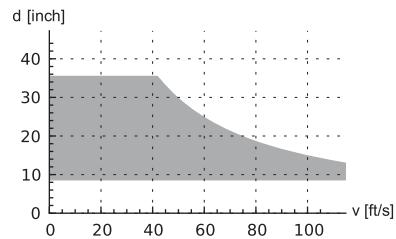

inner pipe diameter  $d$  dependent on the flow velocity  $v$  of the fluid in the pipe

The transducers are selected from the characteristics (see next page). Lamb wave transducers are selected from the left column, shear wave transducers from the right column.

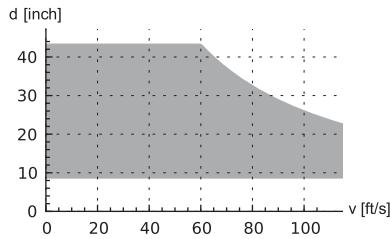

Lamb wave transducers: If the values  $d$  and  $v$  are not in the range, the diagonal arrangement with 1 sound path may be used, i.e. the same characteristics can be used with doubling the inner pipe diameter. If the values are still not in the range, shear waves transducers regarding the pipe wall thickness have to be selected in step 1b.

## Technical data

| type                     | ambient temperature<br>°F |
|--------------------------|---------------------------|
| coupling compound type N | -22 to +266               |
| coupling compound type E | -22 to +392               |
| coupling compound type H | -22 to +482               |
| coupling pad type VT     | 14 to +392                |
| coupling pad type TF     | 392 to 464                |

## Damping material (optional)

Damping material will be used for the gas measurement to reduce acoustic noise influences on the measurement.

### Damping mats

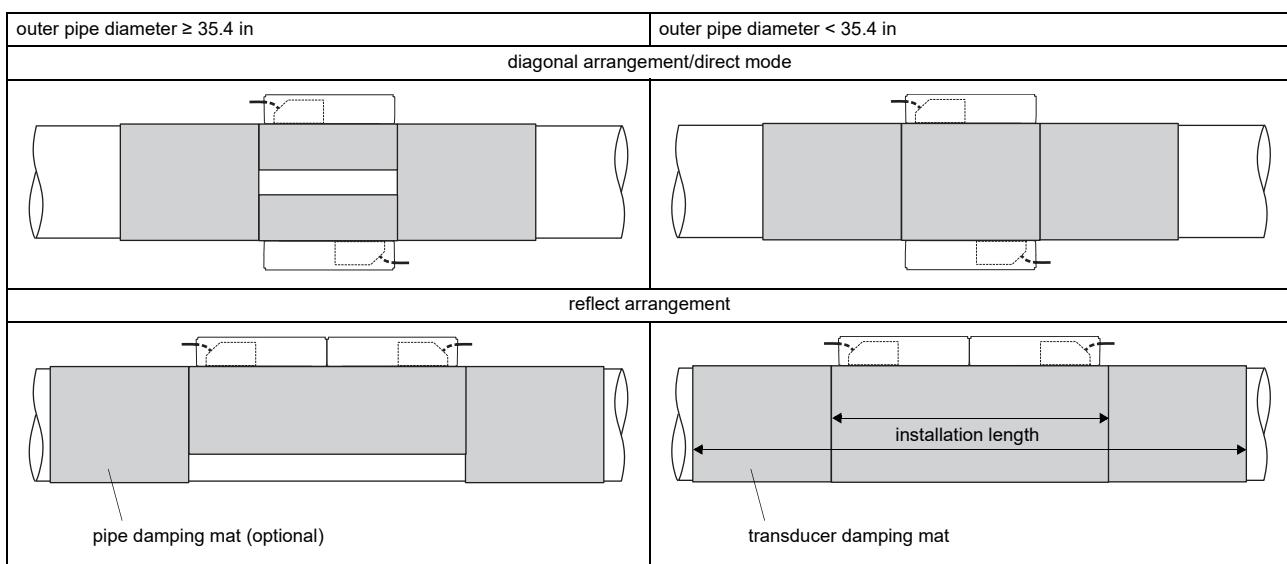

Damping mats will be used for the gas measurement to reduce acoustic noise influences on the measurement.

#### transducer damping mat

Transducer damping mats will be installed below the transducers.

#### pipe damping mat

Pipe damping mats will be installed if the sound propagation is disturbed at reflection points (e.g., flange, weld). Depending on the noise, the pipe damping mats will be installed at one or both sides of the transducer damping mat. If the local conditions are unknown, pipe damping mats should be installed.

<sup>1</sup> calculation on the base of:

max. installation length (installation of one transducer mounting fixture per transducer in reflect arrangement) and  
max. recommended pipe diameter (standard) or max. extended pipe diameter (extended)

<sup>2</sup> calculation for the number of rolls when both transducers are mounted in one transducer mounting fixture (reflect arrangement) or in diagonal arrangement/direct mode: number of rolls/2 and round up to the nearest integer

## Damping coat

For high temperatures it is recommended to apply the damping coat onto the pipe.
